Analytical standards usually are not available for most of the impurities and in some cases, the impurities have not been identified. Because of this, it is often difficult to quantify the exact amount of impurities present in the chemical. In these cases, the assay is given as an area percent assay instead of the purity assay.

Assay means purity, right? - Versum Materials

14.1 Percentage purity of a chemical reaction product. Purity is very important e.g. for analytical standards in laboratories or pharmaceutical products where impurities could have dangerous side effects in a drug or medicine.. However in any chemical process it is almost impossible to get 100.00% purity and so samples are always analysed in industry to monitor the quality of the product.
