This is one of the most important steps of the water cycle. In this case, the underlying factor is the Sun, which heats the water in various water bodies on the planet, like oceans, rivers, lakes, or wells. Even a bucket of water kept outdoors is subjected to evaporation. As the water turns to water vapor, its starts ascending in the atmosphere.

The water cycle describes the existence and movement of water on, in, and above the Earth. Earth's water is always in movement and is always changing states, from liquid to vapor to ice and back again. The water cycle has been working for billions of years and all life on Earth depends on it continuing to work;

A fixed amount of water recirculates around the Earth. Water moves in certain directions from place-to-place (reservoir-to-reservoir) by only certain processes and pathways.

Ice and glaciers are part of the water cycle, even though the water in them moves very slowly. The amount of ice on the Earth goes up and down as the world's climate cools and warms over thousands of years.

The water cycle is a collection of processes that recycles water from the ocean. 97% of the world's water is stored in oceans and seas, 2% is stored in ice, and 1% is fresh water in the air or in rivers and lakes.

The water cycle is also known as the "hydrologic cycle". Precipitation. When too much water has condensed, the water droplets in the clouds become too big and heavy for the air to hold them. And so they fall back down to Earth as rain, snow, hail or sleet, a process known as "precipitation". Collection

Groundwater is water that is found underground in cracks and spaces in the soil, sand and rocks. An area where water fills these spaces is called a phreatic zone or saturated zone. Groundwater is stored in and moves slowly through the layers of soil, sand and rocks.

Water cycle, also called hydrologic cycle, cycle that involves the continuous circulation of water in the Earth-atmosphere system. Of the many processes involved in the water cycle, the most important are evaporation, transpiration, condensation, precipitation, and runoff.

Water cycle keeps providing us with freshwater continuously. This is a reversible cycle, which means every stage in the cycle keeps repeating itself. In this ScienceStruck article, we will focus on how the water cycle works in detail with a simple diagram.
