Multilevel and Longitudinal Modeling Using Stata

The book opens with the conceptual and methodological issues associated with multilevel and longitudinal modeling, followed by a discussion of SPSS data management techniques which facilitate working with multilevel, longitudinal, and/or cross-classified data sets.

Multilevel and Longitudinal Modeling Using Stata, Second Edition, by Sophia Rabe-Hesketh and Anders Skrondal, looks specifically at Stata's treatment of generalized linear mixed models, also known as multilevel or hierarchical models. These models are "mixed" because they allow fixed and random effects, and they are "generalized" because they are appropriate for continuous Gaussian responses as well as binary, count, and other types of limited dependent variables.

The first edition of Rabe-Hesketh and Skrondal's "Multilevel and Longitudinal Modeling Using Stata" was published in 2005. The second edition was released in 2008, and now this third edition in 2012. With each edition the scope of the model's discussed in the text has increased. This release is in fact a 2-volume work, with the first volume devoted to

With data from two activity travel surveys (1997 and 2006) conducted in Austin, Texas, this paper develops a longitudinal multilevel model for estimating the change in the effect of land use on ...

Modeling Longitudinal and Multilevel Data in SAS

From a practical standpoint, both modeling procedures (mixed effects using maximum likelihood estimation of coefficients and generalized estimating equations estimation of coefficients, hereafter referred to as mixed effects and GEE) allow predictive models to be constructed where multiple observations in a dataset are correlated with each other, common in longitudinal and multilevel work. In longitudinal data, the clustering unit is usually an individual with repeated outcome measures over ...

This book demonstrates how to use multilevel and longitudinal modeling techniques available in the IBM SPSS mixed-effects program (MIXED). Annotated screen shots provide readers with a step-by-step understanding of each technique and navigating the program. Readers learn how to set up, run, and interpret a variety of models.

Multilevel Models for Longitudinal Data

The use and quality of longitudinal research designs has increased over the past two decades, and new approaches for analyzing longitudinal data, including multi-level modeling (MLM) and latent growth modeling (LGM), have been developed. The purpose of this paper is to demonstrate the use of MLM and its advantages in analyzing longitudinal data.

Multilevel data structures also arise in longitudinal studies where an individual's responses over time are correlated with each other. Multilevel models recognise the existence of such data hierarchies by allowing for residual components at each level in the hierarchy.
